ACCP Grading System

- Reflects system adopted for all ACCP guidelines
- The strength of any recommendation depends on two factors:
 - The trade-off between benefits, risks, burdens, costs, and level of confidence in estimates of those benefits and risks
 - The quality of the evidence upon which the recommendations are based
- If benefits do (or do not) outweigh risks, burdens, and costs, a strong (Grade 1) recommendation is used.
- If there is less certainty about magnitude of benefits and risks, burdens, and costs, a weak (Grade 2) recommendation is used.
- Support for recommendations may come from high-quality, moderate-quality, or low-quality evidence, labeled, respectively, A, B, and C.
- The phrase "we recommend" is used for strong recommendations (Grade 1A, 1B, 1C) and "we suggest" for weak recommendations (Grade 2A, 2B, 2C).

Perioperative Bridging :General Points

- To eliminate effect of antithrombotic therapy before surgery, treatment should be stopped before surgery (~5 days for Warfarin, 7-10 days for antiplatelet drug) to minimizing bleeding risk
- Giving bridging after surgery increases risk for bleeding; this risk depends on anticoagulant dose (therapeutic-dose > low-dose) and proximity to surgery (higher risk if given closer to surgery)

6/19/2013

19

Table 2. Risk Factors for Major Bleeding While Taking Anticoagulants

Risk factors	Comorbidity and reduced functional capacity	Poor anticoagulant control
Age > 65 years		Previous bleeding problems
Age > 75 years*		Previous stroke
Alcohol abuse	Diabetes mellitus	Recent surgery
Anemia	Frequent falls	Renal failure
Antiplatelet therapy	Liver failure	Thrombocytopenia
Cancer	Metastatic cancer	

Categorization of risk	Estimated absolute risk (%)		
	Low risk (0 risk factors)	Moderate risk (1 risk factor)	High risk (≥ 2 risk factors)
Initial risk (0 to 3 months)	1.6	3.2	12.8
Risk beyond 3 months	0.8	1.6	≥ 6.5

*—Increasing age is an additive risk; therefore, patients older than 75 years are considered to have two risk factors.

American College of Chest Physicians evidence-based clinical practice guidelines [published correction appears in Chest. 2012;142(6):1698-1704]. Chest. 2012;141(2 suppl):e432s.

reference

Postoperative Anticoagulation: time to effect

- In resuming treatment after surgery, it takes:
 - 2-3 days for anticoagulant effect to begin after starting warfarin
 - 3-5 h for peak anticoagulant effect after starting LMWH
 - minutes for an antiplatelet effect to begin after starting ASA
 - 2-7 days for peak inhibition of platelet aggregation after starting a maintenance dose of clopidogrel
